# AI Time-Audit: Before and After Productivity Study

## CAPSTONE 42 — Project summary and measurement template

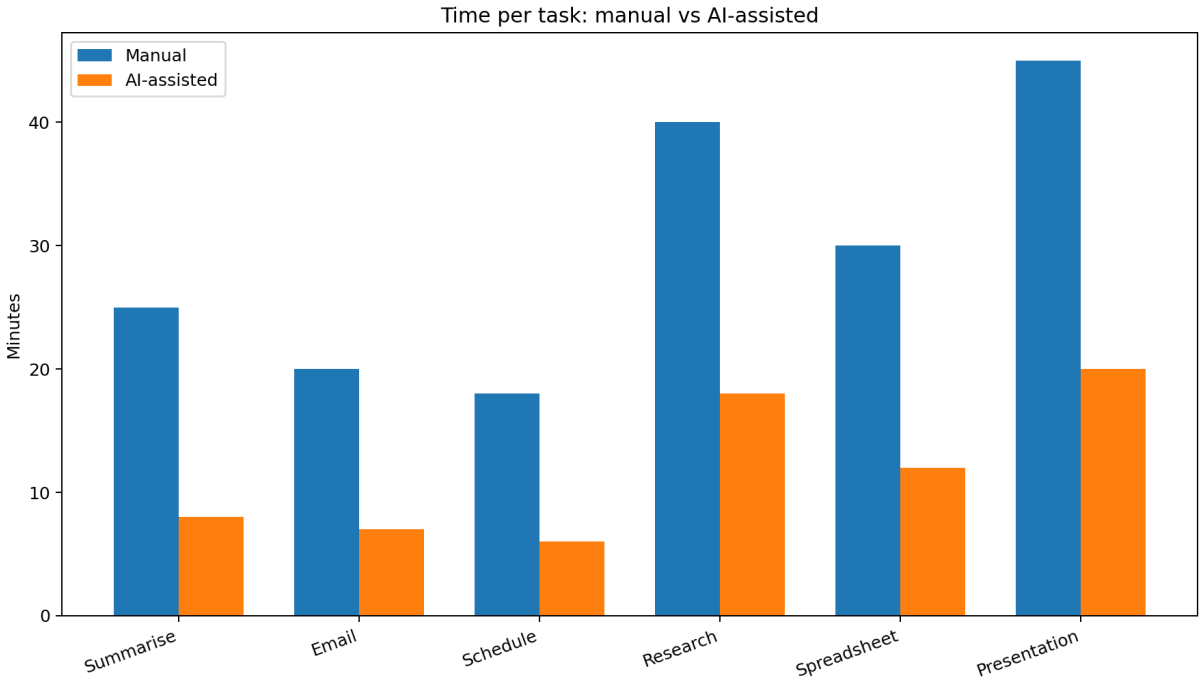

**Data status:** All numbers in this starter pack are illustrative demo values, not actual measured observations.

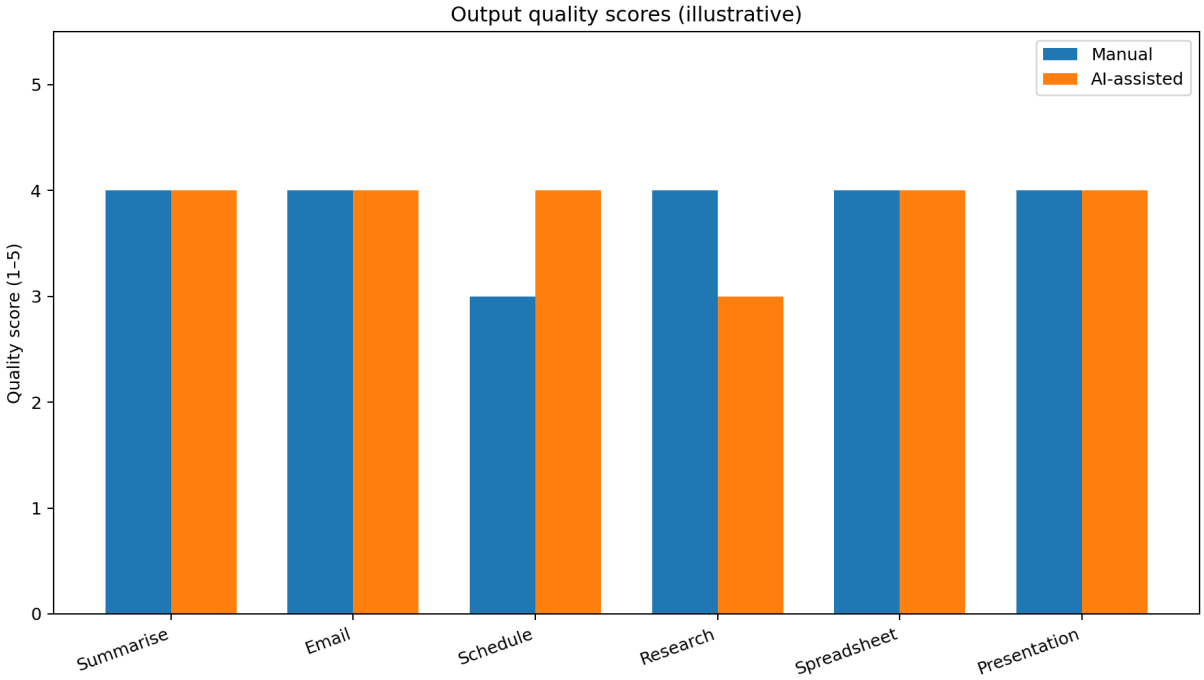

## Research question

How much time can AI save across common student or office tasks, and what happens to output quality?

## Illustrative example results

| Measure | Illustrative value |
|---|---|
| Manual total | 178 minutes |
| AI-assisted total | 71 minutes |
| Time difference | 107 minutes |
| Time saved | 60.1% |
| Mean quality: manual | 3.83/5 |
| Mean quality: AI | 3.83/5 |

# How to conduct the real study

• Choose six comparable tasks and save each task brief.

• Time manual and AI-assisted attempts, including correction and verification.

• Use the same 1–5 quality rubric for both outputs.

• Record prompts, tools, versions, errors, and rework.

• Repeat tasks when possible and use a blind reviewer.

• Replace sample data, regenerate charts, and update the report/presentation.

## Responsible-AI checks

Verify claims and sources independently, test formulas, protect sensitive information, and discuss cases where AI made the result worse. Report only actual measured results as findings.
